The ridges and grooves that make up a fingerprint are impressions of human fingertips. The most common means of proving someone's identity is through their fingerprints. Fingerprints are distinct for each and everyone. In this work, we employed fingerprint analysis to identify various age groups in people. Many video sharing websites use date of birth as proof of age to prevent us from seeing age-restricted content. But a lot of people who are under aged, alter their birth dates to view inaccessible films. We implement age group estimation from fingerprint using KNN classification algorithm in websites to stop this kind of misconduct.
